

# Aussies help keep Bali water clean

Australian Innovative Systems (AIS) has installed six Autochlor systems at Bali's Waterbom waterpark.

Waterbom has more than 20 world class waterslides and leisure facilities set over 3.8 hectares of tropical landscaped parklands. The Autochlor systems are helping keep the park's approximately six million litres of water sanitised.

AIS's commercial Autochlor systems are on-site, in-line chlorine generation plants capable of producing chlorine using low salinity water (2000-2500mg/L TDS) and electricity alone. The salt water electrolysis method provides a safe, clean, compact and easy alternative to the more conventional "mega-dosing" with chemicals.

AIS's managing director, Kerry Gosse says the company's partnership with Bali was formed in 2008.

"We first became involved with Waterbom five years ago and since then have continued to work with them to further upgrade and enhance their water treatment technology in line with their own expansion plans.

"Initially, we simply flew our Autochlor units into the country, which were then installed by a local plumber and electrician within 24 hours. An AIS Engineer then commissioned them on-site the next day. The systems were retrofitted to existing facilities and probably take up about one sixth of the area that would be required by more conventional off-line plants and chlorine storage," says Gosse.

He says the Autochlor units at Waterbom only require 30 minutes of maintenance every 6-12 months.

Waterbom waterpark, located in the heart of Kuta, Bali

In addition to the six commercial Autochlor systems, Waterbom is also using AIS's Ecoline system in their Fantastic Pool which features rides, water cannons, jets and body slides especially designed for small children.
