

# AUSTRALIAN TECHNOLOGY ALLOWS HOTELS AND RESORTS TO BID FAREWELL TO CHLORINE DELIVERIES, HANDLING AND STORAGE FOREVER!

MICHAEL GRIFFIN | CEO, POOL RANGER

Award winning, EcoLine inline chlorinator produces safe, clean and sparkling pool water automatically

For Pool Ranger's CEO Michael Griffin, the most popular response from hotel and resort clients after learning that the EcoLine chlorinator can produce safe, sanitised pool water, automatically and with water and power alone is, "Are you joking?"

It is Pool Ranger that is having the last laugh however. The company, with over 40 years of water industry experience, is a proud distributor of Australian Innovative Systems' (AIS) EcoLine, the world's first inline, fresh water chlorine generator.

The award-winning Australian designed and manufactured system produces chlorine via electrolysis and from the natural minerals and salts present in fresh water. The automatic, inline chlorination means that clients can bid farewell to chlorine deliveries, handling and storage forever.

EcoLine technology is capable of disinfecting thousands of litres of freshwater per minute and is already operating in a range of leading Australian and international resorts and hotels, aquatic facilities and water theme parks.

One of Dubai's most prestigious resorts, the Grand Hyatt uses EcoLine where it is sanitizing a 2.5million litre lagoon at 415,500 litres per hour. The large Indonesian water leisure park, Waterbom Bali, trusts EcoLine to treat up to 6million litres of water in

multiple water features and slides, keeping the park safe and clean for thousands of users. One of Australia's leading casino resorts, Darwin's Skycity is employing the technology in their resort pool as are a number of Municipal swimming pools, aquatic parks and university swimming pools.

Recently, Pool Ranger installed a new EcoLine system at the Warringah Aquatic Centre (WAC) in New South Wales. The centre has approximately 350,000 visitors annually and has hosted Olympic trials and Australian swimming titles.

Pool Ranger understands the hospitality and leisure market's water disinfection needs. EcoLine provides a safe, comfortable and enjoyable swimming experience for guests as well as substantially better air quality, particularly in the case of indoor swimming pools. EcoLine works with current control systems and can be installed or retrofitted in any application.

Explaining some of the key benefits of the technology, Pool Ranger's CEO Michael Griffin says, "One of the primary benefits of an EcoLine system is that chlorine deliveries and storage becomes a thing of the past. There is no need for chlorine tanks, bunded areas or dealing with the excessive

transport costs, particularly in the case of servicing inner city or remote locations.

"Equally important is that there are workplace, health and safety benefits for staff and guests in that there is no requirement to handle or store potentially dangerous quantities of chlorine on site and chemical spills can be avoided."

Michael says that the benefits don't stop there. "In our experience with EcoLine, hotels and resorts can expect a further decrease in plant and equipment costs and an increase in the pool's concrete lifespan, due to the reduction of chloramines in the atmosphere."

The last word goes to WAC's General Manager, Gary Penfold, "It almost sounds too good to be true, but we have site based data to show that the AIS EcoLine system has delivered on all counts. We have outstanding water quality, enhanced amenity and achieved cost savings across a range of areas all whilst keeping the pool compliant with Workplace, Health and Safety regulations. You can't ask for more than that."
